# 14.771: Labor Markets 

Ben Olken

## Poverty and the elasticity of labor supply

Jayachandran (2006): "Selling Labor Low: Wage Responses to Productivity Shocks in Developing Countries"

- Jayachandran's idea:
- The rural wage will be more inelastic if workers are unable to smooth shocks, because they really need the income to survive. In particular it will be more inelastic if there is:
- Less access to credit
- Lower ability to migrate
- Inelastic wages imply larger impacts of productivity shocks on rural welfare.
- They also imply a pecuniary externality - it is not just your own ability to smooth that affects your ability to cope with shocks, but the ability of everyone else around to smooth also affects your welfare.

## Empirical idea

- Empirical goal: estimate labor supply elasticity
- Therefore we need an instrument for labor demand
- Jayachandran uses rainfall shocks as instrument for labor demand:
- Rainshock $=1$ if above 80 th percentile of rain, 0 if between 20th and 80 th, and -1 if below 20th percentile
- Estimating equation:

$$
w_{j t}=\beta_{1} A_{j t}+\beta_{2} S_{j t}+\beta_{3} S_{j t} \times A_{j t}+\beta_{4} X_{j t}+\beta_{5} X_{j t} \times A_{j t}+\delta_{t}+\alpha_{j}+\varepsilon_{j t}
$$

where key coefficients of interest are $\beta_{3}$

- Instruments for $A_{j t}, S_{j t} \times A_{j t}, X_{j t} \times A_{j t}$ with Rainshock ${ }_{j t}, S_{j t} \times$ Rainshock $_{j t}$, $X_{j t} \times$ Rainshock $_{j t}$
- Note: important to include interactions $X_{j t} \times A_{j t}$, not just $X_{j} t$, for controls $X_{j} t$ (e.g. percent agricultural). Why?

## First stage

TABLE 2
Relationship between Agricultural Wage and Crop Yield, Instrumented with Rainfall

## Poverty and Productivity

Kaur, Mullainathan, Oh, and Schilbach: "Do Financial Concerns Make Workers Less Productive?"

- Does poverty make you less productive?
- One channel discussed earlier: nutrition-based poverty traps.
- This paper: is there an cognitive relationship between financial concerns and productivity?
- Empirical approach:
- Style of research: create their own workplace (making woven disposable plates) where they control everything. In between lab and field. Pros/Cons?
- Key empirical test: vary the timing of when wages are paid out. Test how productivity responds to liquidity infusion, holding NPV earnings fixed. Views?
- Compare this effect to changes in the piece rate paid. Find increases in effort associated with increased wages, but - unlike timing - no differences in attentivenesss.
- Concerns? A bunch of careful things done to rule out other hypotheses. Examples
- To test gift-exchange, find no response to announcement of earlier payment. Only payments themselves matter.
- To check nutrition, they directly measure workers' breakfast intake!

Labor Lecture 1

## Identity and Labor Supply

Oh 2020: "Does Identity Affect Labor Supply?"

- Study in India, where paticular castes are historically associated with different types of jobs.
- Question: how much are workers wiling to give up to avoid tasks associated with other castes?And does it matter if it's public or private.
- What do you expect? Is this about India per se, or do you think it's more general?
- Experimental design:
- Similar to Kaur et al, she runs the task, in her case, making paper bags for a fixed daily wage.
- Adds an extra task, either associated with higher or lower castes. Vary the task and the amount of time associated with it ( $10 \mathrm{~min}, 30 \mathrm{~min}, 1 \mathrm{hr}, 1.5 \mathrm{hr}$ ). Why also vary amount of time? Also very whether tasks done are made public in a meeting or not (workers know this.) Why?
- Measures WTA for job using Becker-DeGroot-Marschak. What is this?

## Tasks

## Is there a positive benefit to work per se?

Hussam et al 2021: "The Psychosocial Value of Employment"

- Typical model has something like $U(C, L)$ where $\frac{\partial U}{\partial L}<0$, i.e. disutility of labor
- This paper asks: is that right? Or maybe $\frac{\partial U}{\partial L}>0$ ? And if so why?
- Experimental design: Randomize people into
- Jobs (doing surveys in the camps or 3 days per week, for 2 months)
- Control (small fee to fill out surveys)
- Cash (large fee to fill out surveys, equal to the job arm)
- Views? Is the survey a good / bad job? How does this affect interpretation?
- Why is cash important? Challenges in implementing this?
- Paper works in an extreme setting: Rohingya refugee camps in Bangladesh. Do you think this matters?
- Pre-specify heterogeneity (e.g. past exposure to violence, baseline sociability, baseline depression). Why pre-specify heterogeneity in particular?

## Results

## Labor Demand

- Note that one thing I haven't really mention is labor demand
- Frankly I'm not sure what the interesting questions are here. Ideas? But, I'll leave this as an exercise for future thought.

## Urban labor markets

- We'll examine four questions:
- Do people want urban manufacturing jobs?
- Informal sector
- A big theme that differentiates labor markets in development is the large informal sector.
- Do formal labor market regulations (e.g., min. wage, unions) have bite given the large, unregulated informal sector? Do they lead to more informality?
- Search, signaling, and frictions.
- Do informational problems mean that people have trouble getting hired?
- Labor conditions
- What can / should be done about working conditions?
- What is the role of multinationals?
- Note: would like to see more here!

## Jobs

- First question about labor markets: do people want to be employees, vs. being self-employed?
- Blattman and Dercon (2018) study this by conducting an experiment:
- Take 1,000 applicants to entry level jobs in 5 industrial firms in Ethiopia. Most were unemployed but educated young adults, mostly women.
- Randomly assign $1 / 3$ to get a job with approx. $\$ 1$ hourly wage, $1 / 3$ to an entrepenership program with $\$ 300$ grant, and $1 / 3$ to control group
- Follow outcomes
- Questions to think about:
- How does the selection of workers into this project affect how you think about this experiment?
- How does the selection of firms into this project affect how you think about results?

## Results

## Takeup

## Informal sector

- Besley and Burgess (2004): examine overall industrial labor regulation in India, using state-year diff-in-diff. Find that more 'pro-worker' policies lower output and formal employment and increase poverty.Suggests they matter, but this is very coarse.
- Hsieh and Olken (2016): many firm regulations kick in at discrete thresholds, esp 100 firms in India. Do we see firms avoiding these regulations?

## Indian firm size

## Distribution of Indian Firm Size and Labor Regulations

(size as measured by employment)

- Nothing for formal firms
- Slight bunching for informal firms, but excess mass is at most 400 firms in all of India

## Labor regulation

- Besley and Burgess (2004): examine overall industrial labor regulation in India, using state-year diff-in-diff. Find that more 'pro-worker' policies lower output and formal employment and increase poverty.Suggests they matter, but this is very coarse.
- Hsieh and Olken (2016): many firm regulations kick in at discrete thresholds, esp 100 firms in India. Do we see firms avoiding these regulations?
- Bertrand et al (2017): Why not? Bertrand et al find that firms can get around these constraints by using contract labor, particularly after this was sanctioned by Supreme Court in 2001. Potentially led to more efficiency.

## Larger firms rely on contract labor, esp recently...

Figure 4: Contract Labor Use and Firm Size: 2000 vs 2013

(a) Any Contract
(b) Contract $>50 \%$ Employment

## Labor regulation

- Besley and Burgess (2004): examine overall industrial labor regulation in India, using state-year diff-in-diff. Find that more 'pro-worker' policies lower output and formal employment and increase poverty.Suggests they matter, but this is very coarse.
- Hsieh and Olken (2016): many firm regulations kick in at discrete thresholds, esp 100 firms in India. Do we see firms avoiding these regulations?
- Bertrand et al (2017): Why not? Bertrand et al find that firms can get around these constraints by using contract labor, particularly after this was sanctioned by Supreme Court in 2001. Potentially led to more efficiency.
- Felix and Wong (2021) studying impacts of outsourcing on workers in Brazil... stay tuned

## Do formal regulations affect informal market?

Derenoncourt et al (2021): "Racial Inequality, Minimum Wage Spillovers, and the Informal Sector'

- How does minimum wage affect wages in a context with a large informal sector? And does this affect racial disparities in earnings?
- Setting: Brazil. Large increase in minimum wage from 1999-2009 - min-to-median rose from 30 percent in 1999 to 50 percent in 2009
- National policy, so study it's impacts by looking at percentiles of income distribution over time. Views?
- Examine changes on formal vs. informal sector by looking at heterogeneity in states pre-period income levels

## Spikes at min wage in informal sector

## Changes in formal wages

Figure 3: Monthly earnings distributions for white and nonwhite workers, Brazil

- I would like to see impacts on informal wages
